

IBM DB2 Content Manager Standard Edition, Version 8.3

Highlights

- **Enables development of robust and affordable content management applications for SMBs with IBM @server iSeries systems**
- **Offers a comprehensive, easy-to-use workflow to increase productivity**
- **Integration with IBM middleware using open standards extends existing information assets**

Taking control of content

As business information doubles and triples every year, information management systems become increasingly important to your organization. The challenge is to find a solution that empowers you to take control of your business content—quickly, easily and affordably.

For small to medium-size businesses (SMBs), the answer is IBM DB2® Content Manager Standard Edition, an easy-to-install solution that provides core content management and is currently available on IBM @server® iSeries® systems. Designed for SMBs, DB2 Content Manager Standard Edition enables information to be shared and leveraged across the company, enabling you to reduce costs, enhance productivity and improve responsiveness to your customers and partners.

Central, secure content repository

DB2 Content Manager Standard Edition streamlines information management and delivery to users. The software offloads content such as scanned images, office documents and other files from individual workstations and stores and manages them in a central, secure repository.

With this solution, you can cost effectively capture, manage and protect all forms of business-critical information across diverse applications and business processes. DB2 Content Manager Standard Edition can help you quickly leverage all of your information assets, lowering your cost of ownership and delivering a fast return on investment.

For companies requiring advanced information management functionality at a low price point, DB2 Content Manager Standard Edition is ideal. It allows you to automate paper-based processes and helps to eliminate labor-intensive tasks such as making copies of paper documents, retrieving and distributing records and requesting documents from other departments.

DB2 Content Manager Standard Edition enables you to:

- *Reduce document production, storage and distribution costs.*
- *Safeguard critical assets, including intellectual capital.*
- *Deliver up-to-date, integrated information.*
- *Promote cross-selling and up-selling customer service opportunities.*

Other features of DB2 Content Manager Standard Edition include:

- **Core content management**—*provides the same essential functionality of DB2 Content Manager, including capture and management of information, foldering support, version control, Open Document Management API (ODMA) support, multivalue attributes, security, note logs, document routing, and meta data and search options.*

- **Open standards** – open Internet standards such as HTTP and FTP ensure that the information management system will be available to both public networks as well as private networks and still maintain the highest levels of security.
- **Out-of-the-box clients** – allows access from Web or Windows clients and provides simple-to-understand, intuitive access to all forms of content.
- **Document routing** – provides an easy-to-deploy, consistent and repeatable document routing capability, enhanced with predefined flows and branching capabilities, collection points, and “work lists” to enable users to work from one or multiple workbaskets (work nodes) concurrently.
- **Graphical workflow builder** – allows business users to define the document routing process with graphical workflows that are easy to build and visualize, and provides document routing functions such as decision points, actions, action lists, parallel routing and line-of-business access nodes.
- **XML schema mapping** – ability to export XML data models and documents from one system and import them into another for mapping to DB2 Content Manager schema saves time and simplifies and speeds deployment. XML schema mapping allows XML documents to be captured, shredded, stored and managed by DB2 Content Manager automatically.
- **Comprehensive application programming interface (API) set** – fully exploits the DB2 Content Manager data model and provides integration points for line-of-business applications with Java APIs.

- **Web services support** – a modular Web services interface for use within applications, Web services or in complex business processes provides the ability to dynamically integrate applications, regardless of the programming language they were written in or the platform on which they run, with DB2 Content Manager.

First Steps assures rapid time to value

DB2 Content Manager Standard Edition is easy to install. Its First Steps process allows you to load sample data into the system and work with the information as though it were actual business content. First Steps guides you through the implementation from beginning to end and requires minimal skills.

Part of a comprehensive portfolio of DB2 information management software solutions from IBM, DB2 Content Manager Standard Edition supports the content management needs of SMBs. Consider how DB2 Content Manager Standard Edition can help you manage all of your business information and get your organization running more efficiently.
